Mesenchymal stem cells and psoriasis: State of the art and future perspectives

Mesenchymal stem cells and psoriasis: State of the art and future perspectives

Mesenchymal stem cells for the treatment of psoriasis:
A comprehensive review

Mesenchymal stem cells (MSCs) have recently been shown to have not only regenerative capabilities but also immunomodulating properties. For this reason, they are currently under investigation in clinical trials for the treatment of several autoimmune systemic disorders.

> Stem cells in psoriasis

Psoriasis is a complex chronic relapsing inflammatory disease. Although the exact mechanism remains unknown, it is commonly accepted that the development of psoriasis is a result of multisystem interactions among the epidermis, dermis, blood vessels, immune system, neuroendocrine system, metabolic system, and hematopoietic system.

Stem Cells as Potential Candidates for Psoriasis Cell-Replacement Therapy
